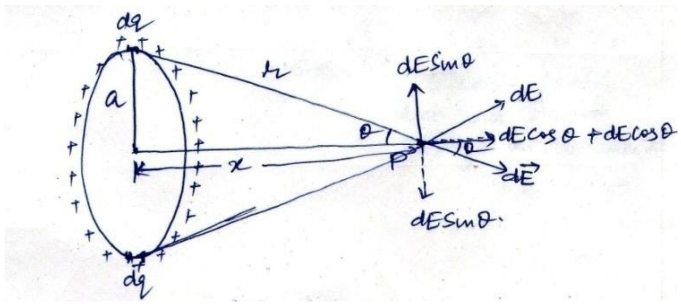
Set1,Q11
Set2,Q14
Set3,Q12

Obtaining an expression for Electric field intensity	2
Showing behavior at large distance	1



½

Net Electric Field at point P = $\int_o^{2\pi a} dE cos\theta$

dE = Electric field due to a small element having charge dq

$= \frac{1}{4\pi\varepsilon_o}\frac{dq}{r^2}$ ½

Let λ = Linear charge density

$= \frac{dq}{dl}$

$dq = \lambda dl$

Hence $E = \int_o^{2\pi a} \frac{1}{4\pi\varepsilon_o} . \frac{\lambda dl}{r^2} \times \frac{x}{r}$, where $\cos\theta = \frac{x}{r}$ ½

$= \frac{\lambda x}{4\pi\varepsilon_o r^3}(2\pi a)$

$= \frac{1}{4\pi\varepsilon_o}\frac{Qx}{(x^2+a^2)^{\frac{3}{2}}}$, where total charge $Q = \boldsymbol{\lambda}\times 2\pi a$ ½

At large distance i.e. x>>a

$E \simeq \frac{1}{4\pi\varepsilon_o} . \frac{Q}{x^2}$ ½

This is the Electric field due to a point charge at distance x. ½

(**NOTE**: Award two marks for this question, if a student attempts this question but does not give the complete answer) 3

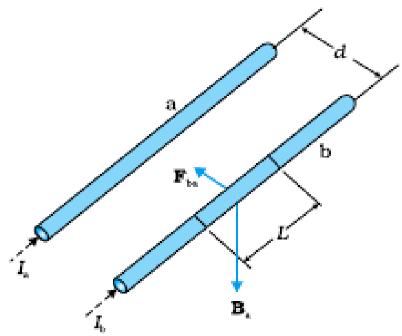
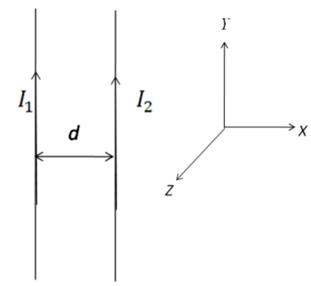
Diagram showing attractive force on other wire.	1
Obtaining an expression for force.	1
Definition of one ampere.	1



As shown in Figure, the direction of force on conductor b is attractive
[Alternatively:
$\vec{B}$ at a point on wire 2, is along -$\hat{k}$
∴ $\vec{F}$, on wire 2, due to the $\vec{B}$, is along -$\hat{\imath}$, i.e. towards wire1. Hence the force is attractive.



Magnetic field, due to current in conductor a,

$$B_1 = \frac{\mu_0 I_1}{2\pi d}$$

The magnitude of force on a length L of conductor b,

$$F_2 = I_2 L B_1$$

$$F_2 = \frac{\mu_0 I_1 I_2 L}{2\pi d}$$

One ampere is that steady current which, when maintained in each of the two very long, straight, parallel conductors, placed one meter apart in vacuum, would produce on each of these conductors a force equal to 2×10^{-7}newton per meter of their length.

	OR		
	Maxwell's generalization of Ampere's Circuital law 1 Showing that current produced, within the plates of a capacitor is $i = \epsilon_0 \frac{d\phi_\epsilon}{dt}$ 2		
	Ampere's circuital law is given by as $\phi \vec{B}.\vec{dl} = \mu_0 i_c$	1	
	But for a circuit containing capacitor, during its charging / discharging the current within the plates of the capacitor varies, (producing displacement current i_d). Therefore, the above equation, as generalized by Maxwell, is given as $\phi \vec{B}.\vec{dl} = \mu_0 i_c + \mu_0 i_d$	1	
	During the process of charging of capacitor, electric flux (ϕ_ϵ) between the plates of capacitor changes with time, which produces the current within the plates of capacitor. This current, being proportional to $\frac{d\phi_\epsilon}{dt}$, we have $$i = \epsilon_0 \frac{d\phi_\epsilon}{dt}$$	1	3
Set1,Q18 Set2,Q21 Set3,Q16	a) Explanation of any two factors justifying the need of modulation 1+ 1 b) Two advantages of FM over AM ½ + ½		
	a) A low frequency signal is modulated for the following purposes: (i) It reduces the wavelength of transmitted signal, and the minimum height of antenna for effective communication is $\lambda/4$. Therefore height of antenna becomes practically achievable.	1	

<table>
